CASE STUDY · TRACKING & ANALYTICS · 2026

RAWDEE GLAMPING · HOSPITALITY · INDONESIA

Their ads were optimising on sales that never happened.

I audited and rebuilt the full measurement stack, from tag to dashboard, so every WhatsApp lead is counted once, under the right name, and read in one place.

5 → 0
Ad sets optimising on fake purchases

2.1×
Ad clicks matched (45.5% → 94.6%)

+12.5%
Leads recovered by server events

100%
Browser + server events deduplicated

GOOGLE TAG MANAGER · GA4 · META PIXEL · CONVERSIONS API · LOOKER STUDIO

PREPARED BY

Muhammad Hasan Fikri

Tracking & Analytics Specialist

9+ years in marketing.
Brand & performance, measured properly.

WHAT I FIX

— Tracking audits
— GTM & GA4 builds
— Meta Pixel + Conversions API
— Looker Studio reporting

01 The challenge

> “We’re spending on Meta ads, but we can’t tell which package people want, which site sends them, or whether the algorithm is learning from the right thing.”

CONTEXT

Rawdee Glamping is a resort in Indonesia that sells every stay through a WhatsApp conversation: no checkout, no booking form. Visitors land on two sites, a landing page for Meta ads and a link-in-bio page for Instagram.

Ads were live and spending. The measurement under them had been patched together over time, and nobody had checked whether it still told the truth.

THE BUSINESS QUESTION

Which interaction sits closest to a WhatsApp booking, and can every signal come from exactly one source?

INDUSTRY	MODEL	SITES	MY ROLE
Hospitality	**Lead gen via WhatsApp**	**Ads LP + Instagram bio**	**Audit → build → QA → report**

THE AUDIT · WHAT I FOUND BEFORE TOUCHING ANYTHING — 2 GTM CONTAINERS · META DATASET · GA4

CRITICAL	**WhatsApp clicks were reported as Purchase.** Five ad sets were optimising toward sales that never happened.
CRITICAL	**Foreign domains were writing into live data.** Three preview domains, plus a sister brand’s site, shared the production dataset.
HIGH	**Hand-coded pixel, duplicate triggers.** Four Custom HTML tags with typed-in IDs and zero variables; one click could fire twice.
HIGH	**An unknown server source.** Old API tokens were sending events nobody could name. Switching on CAPI blind would have doubled the data.
HIGH	**Intent signals merged or missing.** Pricelist and calendar were both ViewContent; the calendar toggle wasn’t tracked at all.
MEDIUM	**Match quality stuck at 6.1/10.** Click ID on fewer than half of events; the Instagram site had no GA4 at all.

SCOPE

2 GTM containers · 1 GA4 property with 2 data streams · 1 Meta dataset + Conversions API · Search Console · Looker Studio built from scratch

JUDGMENT CALL

Meta flagged “set up advanced matching”. With no form there is no email or phone to send, so I skipped it and fixed the real gap: the server path.

02 Before → after

Real screenshots from the client's accounts. Event counts are blurred; rates are shown as reported.

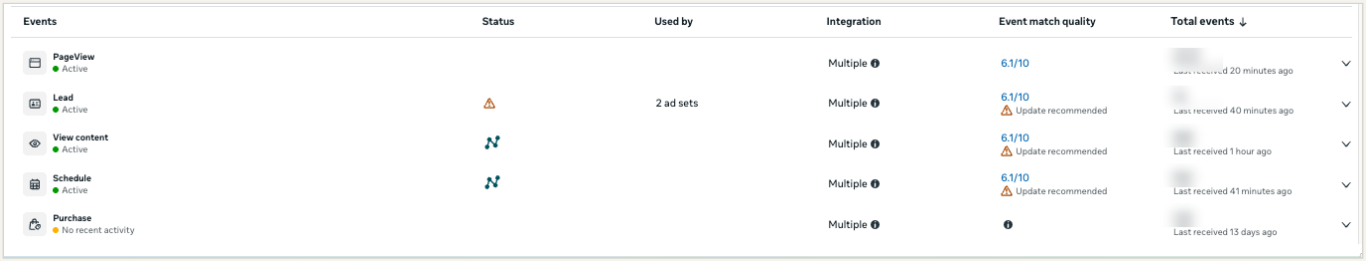

1 · Meta stopped learning from fake sales

WhatsApp clicks are now a Lead, the calendar a Schedule, the pricelist a ViewContent. Purchase went silent the day the old tags were removed.

BEFORE

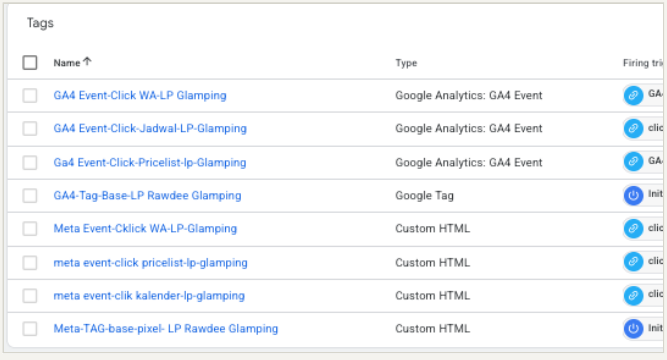

AFTER

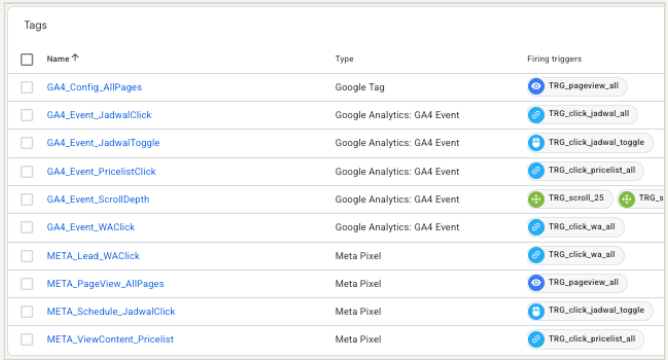

2 · A container anyone can maintain

Backed up, then rebuilt from a clean slate: native templates, 11 variables, one naming convention, mirrored across both sites.

BEFORE

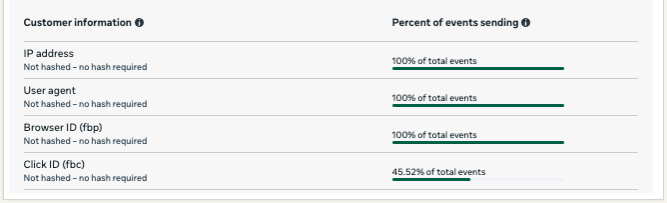

AFTER

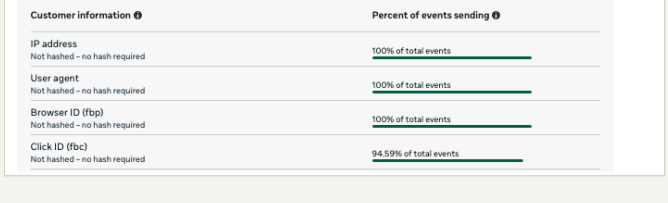

3 · Twice as many ad clicks matched

Traced the old server source first, then switched on Conversions API with event-ID deduplication.

BEFORE · CLICK ID 45.52%

AFTER · CLICK ID 94.59%

03 One clean path, click to dashboard

Every signal has one trigger, one name and one destination, identical on both sites.

01 SOURCE	02 COLLECT	03 SEND	04 READ
2 sites	**2 GTM containers**	**GA4 · Pixel · CAPI**	**Looker Studio**
Ads landing page, Instagram bio	11 variables · 8 triggers · 10 tags, zero hard-coded IDs	Browser + server with a shared event ID	4 pages, emailed every Monday

EVENT MAP · ONE ACTION, ONE NAME, EVERY PLATFORM

USER ACTION	GA4 EVENT	META EVENT	ROLE
Click WhatsApp	wa_click ★	Lead	Primary conversion
Open booking calendar	jadwal_toggle ★	Schedule	High intent
Open pricelist	pricelist_click	ViewContent	Retargeting
Open schedule sheet	jadwal_click	–	Medium, GA4 only
Scroll 25 / 50 / 75%	scroll_depth	–	Engagement
Page load	page_view	PageView	Baseline

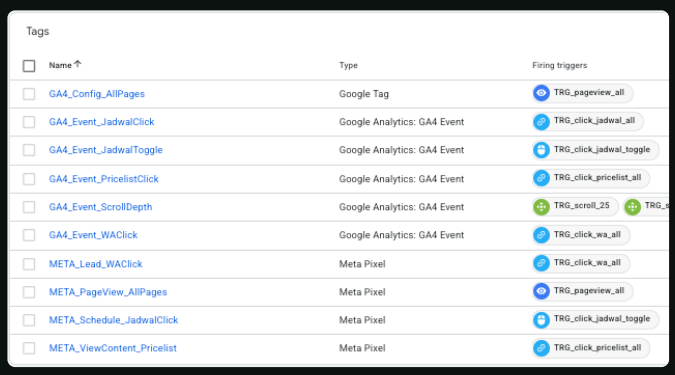

★ GA4 key event. Only two are marked, so conversion reports don't inflate.

Google Tag Manager

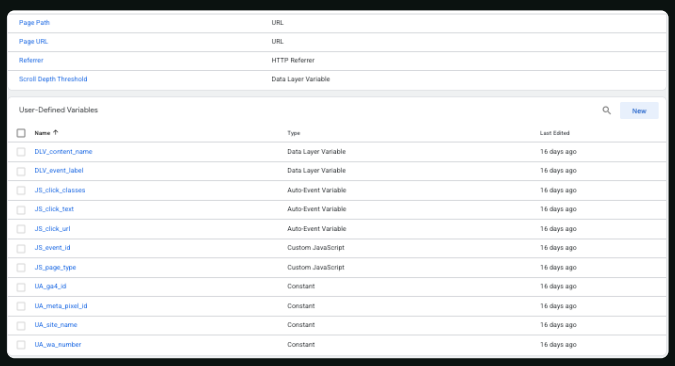

- Backed up, then rebuilt from a clean slate
- Native Meta Pixel template, no Custom HTML
- UA_, JS_, DLV_ variables; nothing hard-coded
- One naming convention, GTM to Looker

Google Analytics 4

- One property, one data stream per site
- Click URL custom dimension: package per click
- Instagram site connected for the first time
- Search Console linked for organic queries

GTM · 10 TAGS, NATIVE TEMPLATES

GTM · 0 → 11 USER-DEFINED VARIABLES

04 Meta Pixel & Conversions API

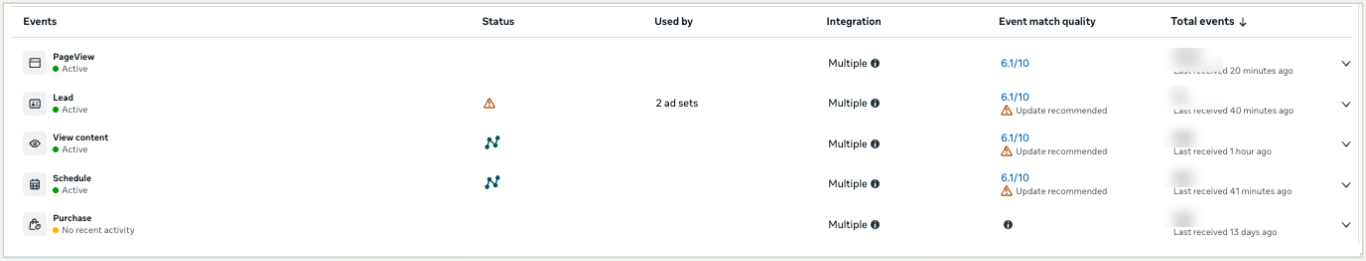

Four standard events from the browser, each copied to the server by Meta-enabled CAPI. No server to host, no token to manage.

+12.5%
Lead events added by the server vs pixel alone

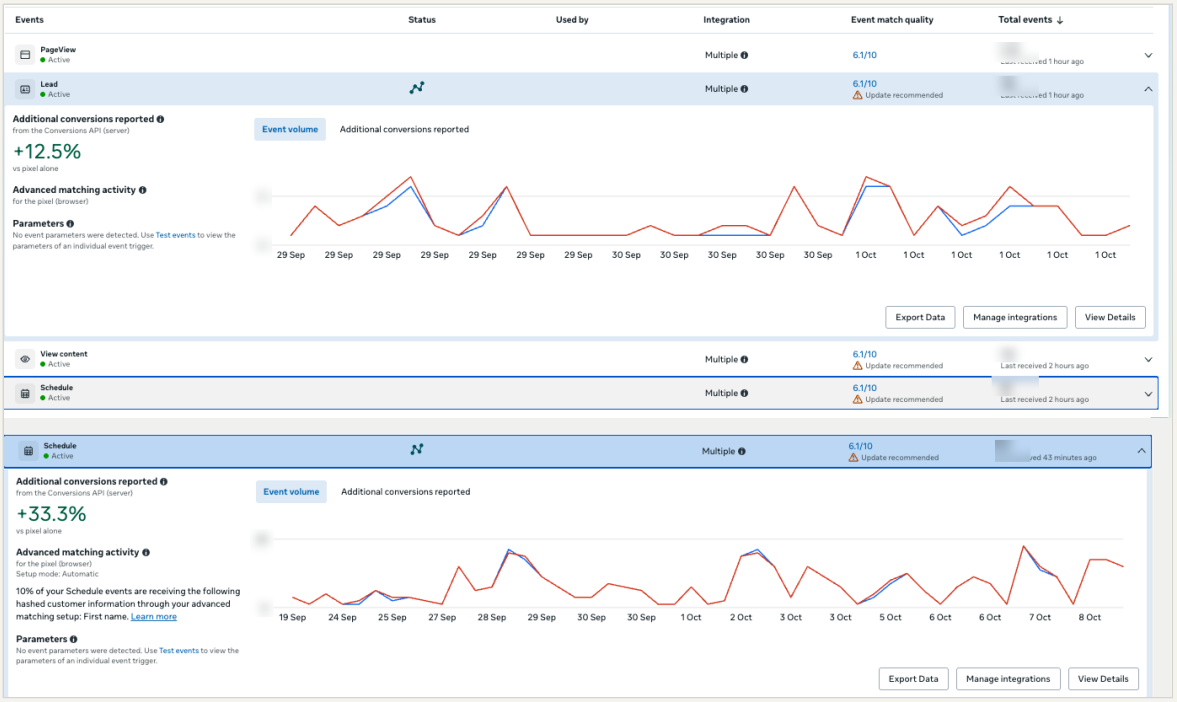

+33.3%
Schedule events added by the server

100%
Browser / server pairs deduplicated by event ID

EVENTS MANAGER · LEAD DRIVES THE AD SETS, PURCHASE IS SILENT

CONVERSIONS API · EXTRA CONVERSIONS REPORTED BY THE SERVER

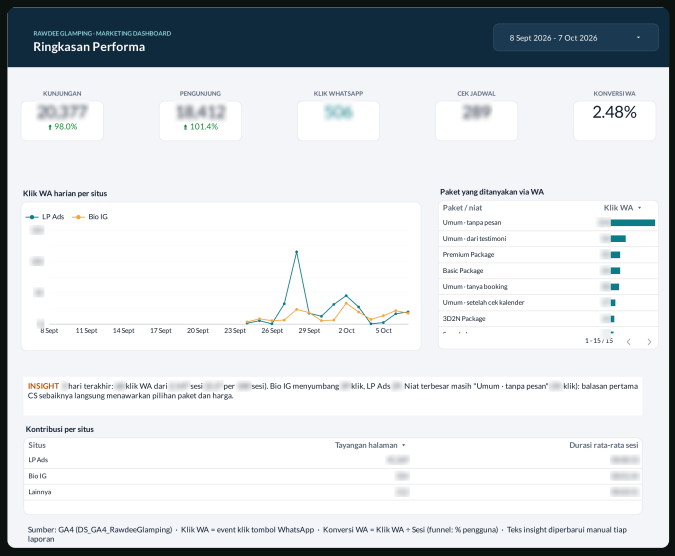

WHY IN THIS ORDER

CAPI copies every pixel event. Switching it on before cleaning the pixel would have copied the fake purchases and foreign-domain traffic too. So: hygiene first, trace the old server source, then switch on.

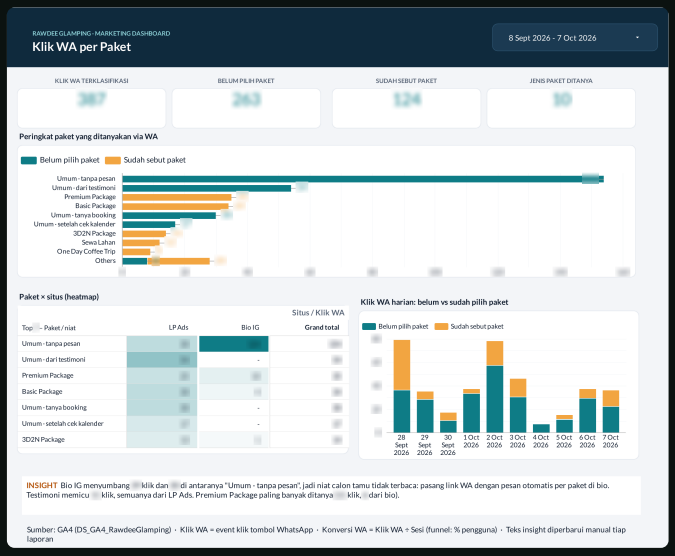

05 Reporting, built from zero

There was no dashboard before. Four pages on the new GA4 data, each with a written insight, so the owner reads a conclusion, not just charts.

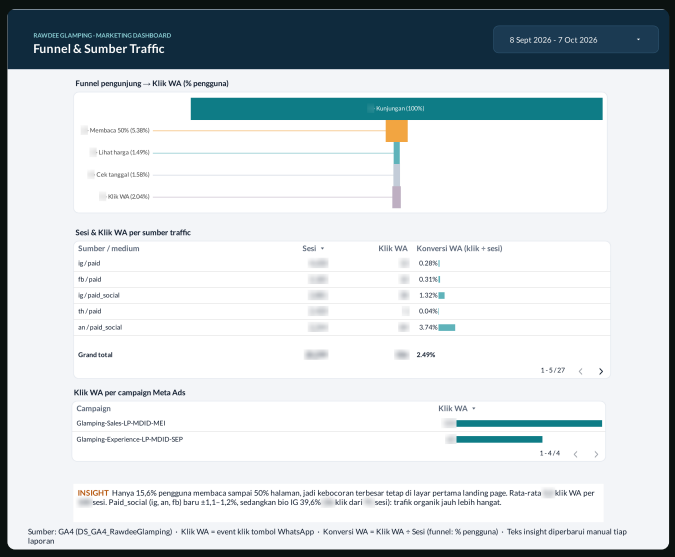

P1 Performance summary

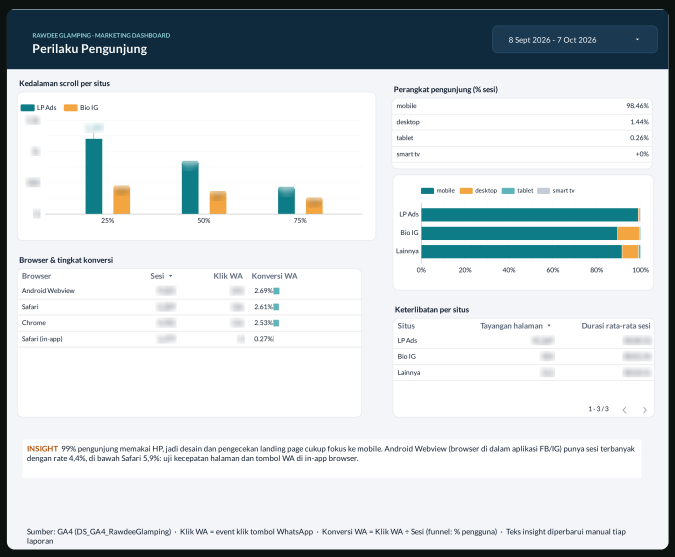

P2 WhatsApp clicks per package

P3 Funnel & traffic sources

P4 Visitor behaviour

PACKAGE DEMAND

Every WhatsApp click carries its package, split by site

WHERE IT LEAKS

Funnel from visit to WhatsApp, by source and campaign

NO SPECIALIST NEEDED

Emailed every Monday, with alerts for sudden drops

06 Results

Read from Meta Events Manager and GTM in early October 2026, a few weeks after go-live.

METRIC	BEFORE	AFTER
Ad sets on fake Purchase	5	**0 · all on Lead**
Click ID (fbc) coverage	45.52%	**94.59%**
Extra conversions from CAPI	—	**+12.5% Lead · +33.3% Schedule**
Browser / server dedup	Untraced source	**100% by event ID**
Custom HTML tags / variables	4 / 0	**0 / 11**
Foreign domains in the data	3	**Blocked by allow list**
Reporting	None	**4-page dashboard, weekly email**

Event match quality still reads 6.1 while Meta collects a full window of server data; the target is 8+. Click ID coverage is the leading indicator.

HOW I WORK · EVERY PHASE ENDS IN A SIGNED-OFF DOCUMENT

F0 Intake — Goals & conversions

F1 Audit — Findings by severity

F2 Architecture — Measurement plan

F3 Build — 27-step guide

F4 QA — 80 checks, 8 sign-offs

F5 Report — Dashboard & handover

WHAT I CAN DO FOR YOUR BUSINESS

Tracking audit
Find what's broken before you spend another dollar on ads.

GTM + GA4 rebuild
Clean, documented, variable-driven. Easy to hand over.

Meta Pixel + CAPI
Deduplicated signals the algorithm can learn from.

Looker Studio
Dashboards that answer one business question.

Tracking that tells the truth.
